

Leak detector

Leak funnel set

Intended Use

- The purpose of the leak funnel set is to make any leaking water of the vertical distribution pipes in the wall visible.
- Decree of the Ministry of the Environment on Water supply and sewerage equipment of properties
13.2 § Detectability of leaks
To detect water leaks, structural solutions must be used which make the leaking water visible.
- The vertical distribution pipes must have layered mechanical or structural leak sensors unless the distribution pipes are visible.*

Features

The leak funnel set consists of a *leak funnel* that is attached to the pipe, a *support cover* installed between the seal and funnel and a *hose clamp* attached to the funnel's pipe, as well as a *leak hose* bringing out any leaking water and a *grommet* together with *seals* that is placed at the other end of the hose.

Leak funnel

The *leak funnel* that is made of an elastic material can be conveniently cut with e.g. a Stanley knife at a suitable point and attached tightly to the pipe with a *hose clamp*.

The funnel is stepped and measured for 10, 12, 15, 18, 22, 28, 32, 35mm pipes used for waterproofing thicknesses of up to 130 mm.

The hose coupling of the leak funnel has a *sieve shape*, which prevents any pipe insulation wool or other impurities from blocking the hose coupling and the leak hose.

Support cover

The *support cover* that is placed inside the leak funnel ensures that the funnel keeps its shape and keeps the pipe insulation in place and prevents it from falling in to the funnel. The pass-through grid on the cover allows the installation of various pipe sizes, and directs a possible leak, including from the insulation, to the funnel.

Leak sensor

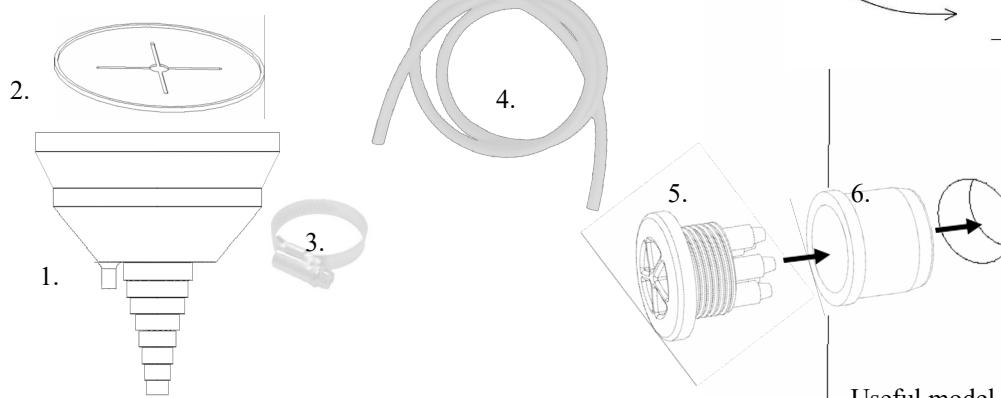

The *leak sensor* that is installed on the wall is easy to install to different thicknesses of wall structures with the *grommet* to which the *leak sensor* wedges against while sealing the wall's pass-through. Five leak funnels can be connected to one *leak sensor*.

The numbered (5) blocks of the pass-through coupling make it easy to identify a leaking pipe on the basis of coupling protocols.

A tidy, unnoticeable pass-through coupling provides a finished look for a bathroom or other visible premises.

Products:

1. Leak funnel
2. Support cover
3. Hose clamp
4. Leak hose
5. Leak sensor
6. Grommet 32mm
